Problem: Continents and Oceans

Launch Code Editor

There will be several continents on a world map. Idea is to identify the number of continents and the mass in each.

The land is denoted by '#' and ocean by spaces. You have to find the number of continents (connected masses of land) and print the number of # in the continent.

Connected mass of land means that # can be connected in any way i.e. horizontally, vertically or diagonally.

Input Format:

- 1. Path to a file, for example /tmp/T1.txt
- 2. This file contains 15 rows and 60 columns depicting a map. See Examples section below.

Output Format:

Number of # per continent in descending order of size and total number of continents in the format depicted below

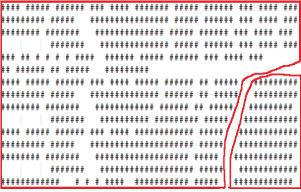

Island 1: <Biggest mass> say 100 Island 2: <Smallest mass> say 50 Number of continents: 2

Example 1:

****** **** ***** ***** ***** **** **** *** ************* ***** ***** *** *** *** ####### ###### ###### ************ ***** ***** *** *** *** ** * * * * * **** ***** ***** ***** *** *** ## ###### ## ##### ######## ******* **** ***** *********** ***** ********** ***** ** ***** ####### ###### ######### ******* ****** **** ############# ******* **** ***** ****************** ############ ******* ****** ########### ###### *************** ############ ###########

Island 1: 593 Island 2: 98 Number of continents: 2

Output:

Output: Island 1: 593 Island 2: 98

Number of continents: 2

Example 2:

#	#	# 1	H	1	#	#	#	+	##	#	#	#	#	#	#	ŧ	ŧ	Ħ	#	#	#	#	#	#	# :	# :	ŧ	##	Ħ	#	#	#	#	#	#	# :	H	H	#	#	#	#	#	#	# :	+	# :	# #	ŧ	Ħ	#	#	#

Output: Island 1: 805 Island 2: 68

Number of continents: 2

Note:

Please do not use package and namespace in your code. For object oriented languages your code should be written in one class.

Note:

Participants submitting solutions in C language should not use functions from <conio.h> / < exist in gcc

Note:

For C and C++, return type of main() function should be int.
